

A scatter plot showing the relationship between the number of species (log scale) and the number of individuals (log scale) for 10 different samples. The data points are colored blue, grey, and black, and shaped as circles, squares, and triangles. The plot shows a general trend of decreasing species richness as the number of individuals increases, with some outliers.

Number of nodes	Erdős-Rényi (blue circles)	Barabási-Albert (grey squares)	Watts-Strogatz (grey triangles)
